
Paragraphs contain text and may contain inline markup: *emphasis*, **strong emphasis**, inline literals, standalone hyperlinks (<http://www.python.org>), external hyperlinks (Python), internal cross-references (example), external hyperlinks with embedded URIs (Python web site), footnote references (manually numbered¹, anonymous auto-numbered², labeled auto-numbered³, or symbolic⁴), and substitution references (☒). Character-level inline markup is also possible (although exceedingly ugly!) in *reStructuredText*. Problems are indicated by |problematic| text (generated by processing errors; this one is intentional).

The default role for interpreted text is *Title Reference*. Here are some explicit interpreted text roles: a PEP reference (PEP 287); an RFC reference (RFC 2822); a subscript; a superscript; and explicit roles for *standard inline* markup.

- A bullet list

1 A footnote contains body elements, consistently indented by at least 3 spaces.

2 This footnote is numbered automatically and anonymously using a label of "#" only.

3 Footnotes may be numbered, either manually (as in ¹) or automatically using a "#"-prefixed label.

4 Footnotes may also use symbols, specified with a "*" label.
