# Chapter 1

## GALAHAD C package lms

### 1.1 Introduction

#### 1.1.1 Purpose

Given a sequence of vectors  $\{s_k\}$  and  $\{y_k\}$  and scale factors  $\{\delta_k\}$ , **obtain the product of a limited-memory secant approximation  $H_k$  (or its inverse) with a given vector**, using one of a variety of well-established formulae.

Currently, only the control and inform parameters are exposed; these are provided and used by other GALAHAD packages with C interfaces.

#### 1.1.2 Authors

N. I. M. Gould, STFC-Rutherford Appleton Laboratory, England.

C interface, additionally J. Fowkes, STFC-Rutherford Appleton Laboratory.

Julia interface, additionally A. Montoison and D. Orban, Polytechnique Montréal.

#### 1.1.3 Originally released

July 2014, C interface January 2022.

#### 1.1.4 Method

Given a sequence of vectors  $\{s_k\}$  and  $\{y_k\}$  and scale factors  $\{\delta_k\}$ , a limited-memory secant approximation  $H_k$  is chosen so that  $H_{\max(k-m,0)} = \delta_k I$ ,  $H_{k-j}s_{k-j} = y_{k-j}$  and  $\|H_{k-j+1} - H_{k-j}\|$  is “small” for  $j = \min(k-1, m-1), \dots, 0$ . Different ways of quantifying “small” distinguish different methods, but the crucial observation is that it is possible to construct  $H_k$  quickly from  $s_k$ ,  $y_k$  and  $\delta_k$ , and to apply it and its inverse to a given vector  $v$ . It is also possible to apply similar formulae to the “shifted” matrix  $H_k + \lambda_k I$  that occurs in trust-region methods.

#### 1.1.5 Reference

The basic methods are those given by

R. H. Byrd, J. Nocedal and R. B. Schnabel (1994) Representations of quasi-Newton matrices and their use in limited memory methods. *Mathematical Programming*, **63**(2) 129-156,

with obvious extensions.

## Chapter 2

# File Index

### 2.1 File List

Here is a list of all files with brief descriptions:

<a href="#">galahad_lms.h</a> . . . . .	5
---	---

## Chapter 3

# File Documentation

### 3.1 galahad\_lms.h File Reference

```
#include <stdbool.h>
#include <stdint.h>
#include "galahad_precision.h"
#include "galahad_cfunctions.h"
```

#### Data Structures

- struct [lms\\_control\\_type](#)
- struct [lms\\_time\\_type](#)
- struct [lms\\_inform\\_type](#)

#### Functions

- void [lms\\_initialize](#) (void \*\*data, struct [lms\\_control\\_type](#) \*control, int \*status)
- void [lms\\_information](#) (void \*\*data, struct [lms\\_inform\\_type](#) \*inform, int \*status)
- void [lms\\_terminate](#) (void \*\*data, struct [lms\\_control\\_type](#) \*control, struct [lms\\_inform\\_type](#) \*inform)

#### 3.1.1 Data Structure Documentation

##### 3.1.1.1 struct [lms\\_control\\_type](#)

control derived type as a C struct

##### Data Fields

bool	<a href="#">f_indexing</a>	use C or Fortran sparse matrix indexing
int	<a href="#">error</a>	unit for error messages
int	<a href="#">out</a>	unit for monitor output
int	<a href="#">print_level</a>	controls level of diagnostic output
int	<a href="#">memory_length</a>	limited memory length

## Data Fields

int	method	limited-memory formula required (others may be added in due course): <ul style="list-style-type: none"> <li>• 1 BFGS (default).</li> <li>• 2 Symmetric Rank-One (SR1).</li> <li>• 3 The inverse of the BFGS formula.</li> <li>• 4 The inverse of the shifted BFGS formula. This should be used instead of .method = 3 whenever a shift is planned.</li> </ul>
bool	any_method	allow space to permit different methods if required (less efficient)
bool	space_critical	if space is critical, ensure allocated arrays are no bigger than needed
bool	deallocate_error_fatal	exit if any deallocation fails
char	prefix[31]	all output lines will be prefixed by prefix(2:LEN(TRIM(.prefix))-1) where prefix contains the required string enclosed in quotes, e.g. "string" or 'string'

## 3.1.1.2 struct lms\_time\_type

time derived type as a C struct

## Data Fields

real_wp_	total	total cpu time spent in the package
real_wp_	setup	cpu time spent setting up space for the secant approximation
real_wp_	form	cpu time spent updating the secant approximation
real_wp_	apply	cpu time spent applying the secant approximation
real_wp_	clock_total	total clock time spent in the package
real_wp_	clock_setup	clock time spent setting up space for the secant approximation
real_wp_	clock_form	clock time spent updating the secant approximation
real_wp_	clock_apply	clock time spent applying the secant approximation

## 3.1.1.3 struct lms\_inform\_type

inform derived type as a C struct

## Data Fields

int	status	<p>the return status. Possible values are:</p> <ul style="list-style-type: none"> <li>• 0 the update was successful.</li> <li>• -1. An allocation error occurred. A message indicating the offending array is written on unit.control.error, and the returned allocation status and a string containing the name of the offending array are held in inform.alloc_status and inform.bad_alloc respectively.</li> <li>• -2. A deallocation error occurred. A message indicating the offending array is written on unit.control.error and the returned allocation status and a string containing the name of the offending array are held in inform.alloc_status and inform.bad_alloc respectively.</li> <li>• -3. One of the restrictions <math>n &gt; 0</math>, <math>\delta &gt; 0</math>, <math>\lambda &gt; 0</math> or <math>s^T y &gt; 0</math> has been violated and the update has been skipped.</li> <li>• -10. The matrix cannot be built from the current vectors <math>\{s_k\}</math> and <math>\{y_k\}</math> and values <math>\delta_k</math> and <math>\lambda_k</math> and the update has been skipped.</li> <li>• -31. A call to the function lhs_apply has been made without a prior call to lhs_form_shift or lhs_form with lambda specified when control.method = 4, or lhs_form_shift has been called when control.method = 3, or lhs_change_method has been called after control.any_method = false was specified when calling lhs_setup.</li> </ul>
int	alloc_status	the status of the last attempted allocation/deallocation
int	length	the number of pairs (s,y) currently used to represent the limited-memory matrix.
bool	updates_skipped	have (s,y) pairs been skipped when forming the limited-memory matrix?
char	bad_alloc[81]	the name of the array for which an allocation/deallocation error occurred.
struct <a href="#">lms_time_type</a>	time	timings (see above)

## 3.1.2 Function Documentation

## 3.1.2.1 lms\_initialize()

```
void lms_initialize (
    void ** data,
    struct lms\_control\_type * control,
    int * status )
```

Set default control values and initialize private data

**Parameters**

in, out	<i>data</i>	holds private internal data
out	<i>control</i>	is a struct containing control information (see <a href="#">lms_control_type</a> )
out	<i>status</i>	is a scalar variable of type int, that gives the exit status from the package. Possible values are (currently): <ul style="list-style-type: none"> <li>• 0. The initialization was succesful.</li> </ul>

**3.1.2.2 lms\_information()**

```
void lms_information (
    void ** data,
    struct lms_inform_type * inform,
    int * status )
```

Provides output information

**Parameters**

in, out	<i>data</i>	holds private internal data
out	<i>inform</i>	is a struct containing output information (see <a href="#">lms_inform_type</a> )
out	<i>status</i>	is a scalar variable of type int, that gives the exit status from the package. Possible values are (currently): <ul style="list-style-type: none"> <li>• 0. The values were recorded succesfully</li> </ul>

**3.1.2.3 lms\_terminate()**

```
void lms_terminate (
    void ** data,
    struct lms_control_type * control,
    struct lms_inform_type * inform )
```

Deallocate all internal private storage

**Parameters**

in, out	<i>data</i>	holds private internal data
out	<i>control</i>	is a struct containing control information (see <a href="#">lms_control_type</a> )
out	<i>inform</i>	is a struct containing output information (see <a href="#">lms_inform_type</a> )
